1. Show that the following statement is true

$$5(3x - 5) - 2(2x + 9) \equiv 11x - 43$$

$$\begin{aligned} 5(3x - 5) - 2(2x + 9) &= 15x - 25 - 4x - 18 \\ &= 15x - 4x - 25 - 18 \\ &= 11x - 43 \end{aligned}$$

(1 mark)

2. Show that the following statement is true

$$(n - 2)^2 - (n - 5)^2 \equiv 3(2n - 7)$$

$$\begin{aligned} (n - 2)^2 - (n - 5)^2 &= (n - 2)(n - 2) - (n - 5)(n - 5) \\ &= n^2 - 2n - 2n + 4 - (n^2 - 5n - 5n + 25) \\ &= n^2 - 4n + 4 - (n^2 - 10n + 25) \\ &= n^2 - 4n + 4 - n^2 + 10n - 25 \\ &= n^2 - n^2 - 4n + 10n + 4 - 25 \\ &= 6n - 21 \\ &= 3(2n - 7) \end{aligned}$$

(2 marks)

3. Show that the following statement is true

$$(n + 2)^2 - 3(n + 4) \equiv (n + 4)(n - 3) + 4$$

$$\begin{aligned}(n + 2)^2 - 3(n + 4) &= (n + 2)(n + 2) - 3(n + 4) \\ &= n^2 + 2n + 2n + 4 - 3n - 12 \\ &= n^2 + n - 12 + 4 \\ &= (n + 4)(n - 3) + 4\end{aligned}$$

(2 marks)

4. Show that the following statement is true

$$3(n + 3)(n - 1) - 3(1 - n) \equiv (3n - 3)(n + 4)$$

$$\begin{aligned}3(n + 3)(n - 1) - 3(1 - n) &= 3(n^2 + 3n - n - 3) - (3 - 3n) \\ &= 3(n^2 + 2n - 3) - 3 + 3n \\ &= 3n^2 + 6n - 9 - 3 + 3n \\ &= 3n^2 + 9n - 12 \\ &= (3n - 3)(n + 4)\end{aligned}$$

(2 marks)

5. Prove that

$$(n + 3)^2 + n(3 - n) - 3(n + 4)$$

is a multiple of 3 for all integer values of n .

$$\begin{aligned}(n + 3)^2 + n(3 - n) - 3(n + 4) &= (n + 3)(n + 3) + (3n - n^2) - (3n + 12) \\ &= n^2 + 3n + 3n + 9 + 3n - n^2 - 3n - 12 \\ &= 6n - 3 \\ &= 3(2n - 1)\end{aligned}$$

3 can be removed as a factor, so is divisible by 3 and therefore a multiple of 3.

(2 marks)

6. Prove algebraically that the sum of two consecutive numbers is odd.

If a number is n , then the next number is $n + 1$.

$$\text{The sum is therefore } n + n + 1 = 2n + 1$$

By definition, $2n$ is even, and so $2n + 1$ must be odd.

(2 marks)

7. Prove algebraically that the sum of the squares of two consecutive multiples of 5 is not a multiple of 10.

A multiple of 5 would be $5n$, the next consecutive multiple of 5 would be $5n + 5$

$$\begin{aligned}(5n)^2 + (5n + 5)^2 &= 25n^2 + 25n^2 + 25n + 25n + 25 \\ &= 50n^2 + 50n + 25\end{aligned}$$

What would the remainder be if this number were divided by 10?

$$50n^2 + 50n + 25 = 10(5n^2 + 5n + 2) + 5$$

Remainder of 5

(2 marks, 1 mark)

8. Tom says that $7x - (2x + 3)(x + 2)$ is always negative.

Is he correct? Explain your answer.

$$\begin{aligned}7x - (2x + 3)(x + 2) &= 7x - (2x^2 + 4x + 4x + 6) \\ &= 7x - 2x^2 - 8x - 6 \\ &= -2x^2 - x - 6 \\ &= -(2x^2 + x + 6)\end{aligned}$$

$2x^2 + x + 6$ is always positive, so multiplying by negative number means that the answer is always negative, as tom suggest.

Change a single number in Tom's statement that would lead to a change in your conclusion. Why is this the case?

Changing the +3 into a -3 or +2 into a -2 would give a negative number when expanding the brackets, but would then be made positive when multiplying by negative 1.

(3 marks, 1 mark)

9. Show that the difference between 14^{20} and 21^2 is a multiple of 7.

$$\begin{aligned}14^{20} - 21^2 &= (7 \times 2)^{20} - (7 \times 3)^2 \\ &= 7^{20} \times 2^{20} - 7^2 \times 3^2 \\ &= 7(7^{19} \times 2^{20} - 7 \times 3^2)\end{aligned}$$

A factor of 7 can be taken out, so the answer must be divisible by 7, and therefore a multiple of 7.

(3 marks)

10. Show that $3^{60} - 25$ is not a prime number.

*3^{60} is always odd, because you are multiplying odd numbers.
25 is odd.*

The difference between two odd numbers, i.e. subtracting them, is always even.

$3^{60} - 25$ is going to be even.

All even numbers are divisible by 2, so $3^{60} - 25$ is not prime.

(2 marks)

11. Part of a 10x10 1-100 number grid is pictured below.

1	2	3	4	5
11	12	13	14	15
21	22	23	24	25
31	32	33	34	35
41	42	43	44	45

A 2x2 square of numbers is selected.
The following operation is performed:

Difference of the leading diagonal \times Difference of the other diagonal

$$(23 - 12) \times (22 - 13) = 11 \times 9 = 99$$

Verify that this is also the case for a different 2x2 square of numbers on the grid.

Consider the square shown, for example:

$$(44 - 33) \times (43 - 34) = 11 \times 9 = 99$$

By generalising, prove this result for all possible 2x2 squares on the grid.

Taking the top left number as n , the other numbers can be written in terms of n .

n	$n + 1$
$n + 10$	$n + 11$

$$(n + 11 - n) \times (n + 10 - (n + 1)) = 11 \times (n + 10 - n - 1) = 11 \times 9 = 99$$

(1 mark, 3 marks)

12. The quadratic formula

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

is a re-arrangement of the general quadratic equation

$$ax^2 + bx + c = 0$$

By completing the square on the general quadratic equation, prove this result.

$$ax^2 + bx + c = 0$$

$$x^2 + \frac{b}{a}x + \frac{c}{a} = 0$$

$$\left(x + \frac{b}{2a}\right)^2 + \frac{c}{a} - \frac{b^2}{4a^2} = 0$$

$$\left(x + \frac{b}{2a}\right)^2 + \frac{4ac}{4a^2} - \frac{b^2}{4a^2} = 0$$

$$\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a^2} = 0$$

$$\left(x + \frac{b}{2a}\right)^2 = -\frac{4ac - b^2}{4a^2}$$

$$\left(x + \frac{b}{2a}\right)^2 = \frac{b^2 - 4ac}{4a^2}$$

$$x + \frac{b}{2a} = \pm \sqrt{\frac{b^2 - 4ac}{4a^2}}$$

$$x + \frac{b}{2a} = \frac{\pm \sqrt{b^2 - 4ac}}{\sqrt{4a^2}}$$

Visit <http://www.mathsmadeeasy.co.uk/> for more fantastic resources.

$$x + \frac{b}{2a} = \frac{\pm\sqrt{b^2 - 4ac}}{2a}$$

$$x = \frac{\pm\sqrt{b^2 - 4ac}}{2a} - \frac{b}{2a}$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$
