1

In 1929, the astronomer Edwin Hubble observed that the light from galaxies moving away from the Earth had longer wavelengths than expected.

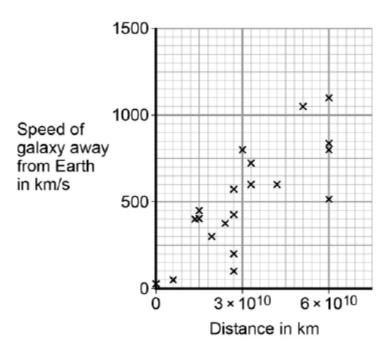

(a) What name is given to this effect?

(1)

(b) From his observations, Hubble was able to calculate the speed of a galaxy and the distance of the galaxy from the Earth.

Figure 1 shows the results of Hubble's calculations.

Figure 1

What relationship between the speed of a galaxy and the distance is suggested by Hubble's results?

(1)

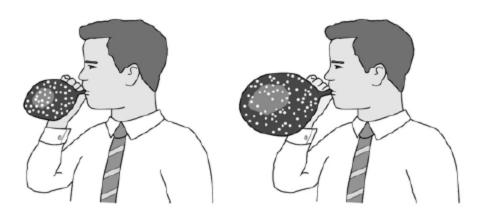

Rossett+School Page 2 of 38

The observations made by Hubble support the idea that the Universe is expanding. This means that galaxies are continually moving away from each other and from the Earth.

Figure 2 shows a student using a balloon to model the idea of an expanding Universe.

Some dots, which represent galaxies, were marked on the balloon. The balloon was then inflated.

Figure 2

(c)	Give <b>one</b> strength and <b>one</b> weakness of this model in representing the idea of an expanding Universe.	
	Strength	
	Weakness	
		(2
In the	e 1950s there were two main theories to explain how the Universe began.	
Th	The Universe has always existed, it is continually expanding. New galaxies are formed as older galaxies die out.	s
Th	The Universe began from a very small region that was extremely hot and dense. The Universe has been expanding ever since.	
(d)	In what way do the observations made by Hubble support both Theory 1 and Theory 2?

Then use it to answer the questions below.

A Microwave "noise" reaches Earth with almost the same intensity from every direction. It is called cosmic microwave background radiation.	<b>B</b> All bodies with a temperature above zero kelvin (–273°C) emit electromagnetic radiation.	C  Measurements made by the COBE satellite showed that there are very slight "ripples" in the cosmic microwave background radiation.
Bodies which emit radiation do so across a range of frequencies, as shown on the graph.  Energy emitted  final Frequency Frequency	E Radiation in the microwave region of the electromagnetic spectrum reaches Earth from many stars and galaxies.	F In 1965, the astronomers Penzias and Wilson stopped trying to eliminate "noise" from their microwave detectors and studied it instead.
<b>G</b> The frequency at which a body radiates most energy $(f_{max})$ is directly proportional to the kelvin temperature.	H Cosmic microwave background radiation has an energy profile matching a temperature of 3 kelvin (–270°C).	I Because of the expansion of the Universe, the temperature of radiation from the time of the big bang will now be only a few kelvin.
J The early universe could not have been completely uniform otherwise galaxies would never have formed.		

(You may find it helpful to begin by deciding which items of information belong to which question.)
