Answer ALL questions. Write your answers in the spaces provided.

1. [In this question position vectors are given relative to a fixed origin $O$ ]

At time $t$ seconds, where $t \geqslant 0$, a particle, $P$, moves so that its velocity $\mathbf{v} \mathrm{m} \mathrm{s}^{-1}$ is given by

$$
\mathbf{v}=6 t \mathbf{i}-5 t^{\frac{3}{2}} \mathbf{j}
$$

When $t=0$, the position vector of $P$ is $(-20 \mathbf{i}+20 \mathbf{j}) \mathrm{m}$.
(a) Find the acceleration of $P$ when $t=4$
(b) Find the position vector of $P$ when $t=4$

$$
\text { a) } \quad \begin{aligned}
\underline{a}=\frac{d \underline{v}}{d t} & =6 \underline{i}-5\left(\frac{3}{2}\right) t^{1 / 2} \underline{\jmath} \\
& =6 \underline{i}-\frac{15}{2} t^{1 / 2} \underline{\jmath} \\
t=4 & \Rightarrow \underline{a}=6 i-15 \underline{\jmath}
\end{aligned}
$$

b) $\underline{s}=\int \underline{v} d t$

$$
=\int 6 t i-5 t^{\frac{3}{2}} \jmath d t
$$

$$
=3 t^{2} \underline{1}-2 t^{5 / 2} \underline{\jmath}+\underline{s}_{0}
$$

$$
t=0:
$$

$$
-20 \underline{i}+20 \underline{j}=S_{0}
$$

$$
\Rightarrow \quad \underline{S}=\left(3 t^{2}-20\right) i+\left(20-2 t^{5 / 2}\right) \underline{\jmath}
$$

$$
t=4:
$$

$$
\begin{aligned}
S & =(48-20) \hat{i}+(20-64) \underline{\jmath} \\
& =28 i-44 \hat{\jmath}
\end{aligned}
$$

2. A particle, $P$, moves with constant acceleration $(2 \mathbf{i}-3 \mathbf{j}) \mathrm{m} \mathrm{s}^{-2}$

At time $t=0$, the particle is at the point $A$ and is moving with velocity $(-\mathbf{i}+4 \mathbf{j}) \mathrm{m} \mathrm{s}^{-1}$
At time $t=T$ seconds, $P$ is moving in the direction of vector $(3 \mathbf{i}-4 \mathbf{j})$
(a) Find the value of $T$.

At time $t=4$ seconds, $P$ is at the point $B$.
(b) Find the distance $A B$.
a)

$$
\begin{align*}
& \underline{v}=\underline{u}+\underline{a} t .  \tag{4}\\
& \underline{v}=(-\underline{i}+4 \underline{j})+(2 i-3 \underline{j}) T \\
& \\
& \frac{4-3 T}{-1+2 T}=-4 / 3
\end{align*}
$$

$$
\begin{gathered}
12-9 T=4-8 T \\
\Rightarrow \quad T=8 .
\end{gathered}
$$

b) $\underline{s}=\underline{u} t+1 / 2 \underline{a} t^{2}$.

$$
\left.\underline{S}_{\overrightarrow{A B}}=(-i+4 \underline{j}) t+(i-3 / 2)\right) t^{2}
$$

$$
\begin{aligned}
& t=4: \\
&=-4 \overrightarrow{A B} \\
&=-4 \hat{i}+16 \underline{j}+16 \underline{i}-24 \underline{j} \\
& \Rightarrow|A B|=\sqrt{12^{2}+\delta^{2}}=\sqrt{208}=14.42 \mathrm{~m} .
\end{aligned}
$$

3. 

Figure 1
Two blocks, $A$ and $B$, of masses $2 m$ and $3 m$ respectively, are attached to the ends of a light string.

Initially $A$ is held at rest on a fixed rough plane.
The plane is inclined at angle $\alpha$ to the horizontal ground, where $\tan \alpha=\frac{5}{12}$
The string passes over a small smooth pulley, $P$, fixed at the top of the plane.
The part of the string from $A$ to $P$ is parallel to a line of greatest slope of the plane.
Block $B$ hangs freely below $P$, as shown in Figure 1.
The coefficient of friction between $A$ and the plane is $\frac{2}{3}$
The blocks are released from rest with the string taut and $A$ moves up the plane.
The tension in the string immediately after the blocks are released is $T$.
The blocks are modelled as particles and the string is modelled as being inextensible.
(a) Show that $T=\frac{12 m g}{5}$

After $B$ reaches the ground, $A$ continues to move up the plane until it comes to rest before reaching $P$.
(b) Determine whether $A$ will remain at rest, carefully justifying your answer.
(c) Suggest two refinements to the model that would make it more realistic.
a) $R_{A}=2 \mathrm{mg} \cos \alpha=\frac{24}{13} \mathrm{mg}$.

$$
\begin{aligned}
& \text { Fr is limiting: } \\
& \qquad F_{r_{A}}=\frac{2}{3} \times \frac{24}{13} \mathrm{mg} .=\frac{48}{39} \mathrm{mg} .
\end{aligned}
$$

Question 3 continued

$$
\begin{aligned}
& \text { A: } \quad T-\left(2 m g \sin \alpha+\frac{48}{39} m g\right)=2 m a . \\
& \Rightarrow T-\left(\frac{30}{39}+\frac{48}{39}\right) m g=2 m a \\
& \Rightarrow T-2 m g=2 m a . \\
& \Rightarrow 3 T-6 m g=6 m a
\end{aligned}
$$

B: $\quad 3 m g-T=3 m a$

$$
\begin{aligned}
& \Rightarrow 6 m g-2 T=6 m a . \\
& \Rightarrow 6 m g-2 T=3 T-6 m g \\
& \Rightarrow 12 m g=5 T \\
& \Rightarrow T=\frac{12 m g}{5} .
\end{aligned}
$$

b) $\quad F_{\text {max }}=\frac{16}{13} \mathrm{mg}$.

$$
\begin{gathered}
2 m g \sin \alpha=\frac{10}{13} \mathrm{mg} \\
\frac{16}{13} \mathrm{mg}>\frac{10}{13} \mathrm{mg}
\end{gathered}
$$

So A will not move down the plane.
c) Allow the sting to be extensible. Involve friction at the pulley $P$.
4.

Figure 2
A ramp, $A B$, of length 8 m and mass 20 kg , rests in equilibrium with the end $A$ on rough horizontal ground.

The ramp rests on a smooth solid cylindrical drum which is partly under the ground The drum is fixed with its axis at the same horizontal level as $A$.

The point of contact between the ramp and the drum is $C$, where $A C=5 \mathrm{~m}$, as shown in Figure 2.

The ramp is resting in a vertical plane which is perpendicular to the axis of the drum, at an angle $\theta$ to the horizontal, where $\tan \theta=\frac{7}{24}$

The ramp is modelled as a uniform rod.
(a) Explain why the reaction from the drum on the ramp at point $C$ acts in a direction which is perpendicular to the ramp.
(b) Find the magnitude of the resultant force acting on the ramp at $A$.

The ramp is still in equilibrium in the position shown in Figure 2 but the ramp is not now modelled as being uniform.

Given that the centre of mass of the ramp is assumed to be closer to $A$ than to $B$,
(c) state how this would affect the magnitude of the normal reaction between the ramp and the drum at $C$.

Question 4 continued
b) Resolving vertically: $R_{A}+R_{c} \cos \theta=20 \mathrm{~g}$.

Resolving horizontally: $F_{r}=R_{c} \sin \theta$

Moments about $A$ :

$$
\left.\begin{array}{rl}
20 g \times 4 \cos \theta=5 R_{c}
\end{array}\right] .
$$

$$
\begin{aligned}
R_{A} & =20 g-R_{c} \cos \theta \\
& =51.49312 \mathrm{~N}
\end{aligned}
$$

$$
F_{r}=150.528 \times \frac{7}{25}=42.14784
$$

$$
\begin{aligned}
\Rightarrow \mid \text { Force at } A \mid & =\sqrt{51.49312^{2}+42.14784^{2}} \\
& =\sqrt{4427.981824} \\
& =66.54 \mathrm{~N} .
\end{aligned}
$$

c) The magaitude of the reaction at $C$, " $R_{C}$ " would decrease.
5.

Figure 3
The points $A$ and $B$ lie 50 m apart on horizontal ground.
At time $t=0$ two small balls, $P$ and $Q$, are projected in the vertical plane containing $A B$.
Ball $P$ is projected from $A$ with speed $20 \mathrm{~m} \mathrm{~s}^{-1}$ at $30^{\circ}$ to $A B$.
Ball $Q$ is projected from $B$ with speed $u \mathrm{~ms}^{-1}$ at angle $\theta$ to $B A$, as shown in Figure 3.
At time $t=2$ seconds, $P$ and $Q$ collide.
Until they collide, the balls are modelled as particles moving freely under gravity.
(a) Find the velocity of $P$ at the instant before it collides with $Q$.
(b) Find
(i) the size of angle $\theta$,
(ii) the value of $u$.
(6)
(c) State one limitation of the model, other than air resistance, that could affect the accuracy of your answers.
(1)
a) A: Horizontal: $20 \cos 30^{\circ}$.

$$
\begin{aligned}
& \text { Vertical: } \quad u=20 \sin 30^{\circ}, a=-9.8, \quad t=2, v=? \\
& v=20 \sin 30^{\circ}-19.6=-9.6 \\
&\left|V_{A}\right|=\sqrt{\left(20 \cos 30^{\circ}\right)^{2}+9.6^{2}}=19.8 \mathrm{~ms}^{-1} .
\end{aligned}
$$

b)i, $\boldsymbol{i}$ Horizontal: $\quad A: \quad S=S_{A}, u=20 \cos 30^{\circ}, a=0, t=2$

$$
B: \quad S=S_{B}, \quad u=u \cos \theta, \quad a=0, \quad t=2 .
$$

$$
\begin{aligned}
& S_{A}+S_{B}=50 . \\
& \begin{aligned}
& S_{A}=40 \cos 30^{\circ} \\
& S_{B}=2 u \cos \theta . \\
& \Rightarrow \quad 2 u \cos \theta=50-20 \sqrt{3} . \\
& \Rightarrow u \cos \theta=25-10 \sqrt{3}
\end{aligned}
\end{aligned}
$$

Question 5 continued
Vertical:

$$
\begin{aligned}
& A: \quad S=S_{A}, \quad u=20 \sin 30^{\circ}, \quad a=-g, t=2 . \\
& B: \quad S=S, \quad u=u \sin \theta, \quad a=-9, \quad t=2 .
\end{aligned}
$$

$$
\begin{aligned}
A: \quad S= & 20-2 g \\
B: \quad S= & 2 u \sin \theta-2 g . \\
& \Rightarrow \quad 2 u \sin \theta=20 \\
& \Rightarrow u \sin \theta=10 .
\end{aligned}
$$

$$
\begin{aligned}
& u \sin \theta=(0, \quad u \cos \theta=25-10 \sqrt{3} \\
& \Rightarrow u^{*}=\sqrt{10^{2}+(25-10 \sqrt{3})^{2}}=12.609 \mathrm{~ms}^{-1} . \\
& \tan \theta=\frac{10}{25-10 \sqrt{3}} \\
& \Rightarrow \theta=\tan ^{-1}\left(\frac{10}{25-10 \sqrt{3}}\right)=52.478^{\circ} .
\end{aligned}
$$

c) The model doesn't consider the fact that the balls are not particles, so they do not move freely under granity.
