Answer ALL questions. Write your answers in the spaces provided.

1. Three bags, $A, B$ and $C$, each contain 1 red marble and some green marbles.

Bag $A$ contains 1 red marble and 9 green marbles only
Bag $B$ contains 1 red marble and 4 green marbles only
Bag $C$ contains 1 red marble and 2 green marbles only
Sasha selects at random one marble from bag $A$.
If he selects a red marble, he stops selecting.
If the marble is green, he continues by selecting at random one marble from bag $B$.
If he selects a red marble, he stops selecting.
If the marble is green, he continues by selecting at random one marble from bag $C$.
(a) Draw a tree diagram to represent this information.
(b) Find the probability that Sasha selects 3 green marbles.
(c) Find the probability that Sasha selects at least 1 marble of each colour.
(d) Given that Sasha selects a red marble, find the probability that he selects it from bag $B$.

b) $\frac{9}{10} \times \frac{4}{5} \times \frac{2}{3}=\frac{72}{150}=\frac{12}{25}$.
C) $(9 / 10 \times 1 / 5)+(9 / 10 \times 4 / 5 \times 1 / 3)=21 / 50$.

2.

Temperature $\left({ }^{\circ} \mathrm{C}\right)$
Figure 1
The partially completed box plot in Figure 1 shows the distribution of daily mean air temperatures using the data from the large data set for Beijing in 2015

An outlier is defined as a value
more than $1.5 \times \mathrm{IQR}$ below $Q_{1}$ or more than $1.5 \times \mathrm{IQR}$ above $Q_{3}$

The three lowest air temperatures in the data set are $7.6^{\circ} \mathrm{C}, 8.1^{\circ} \mathrm{C}$ and $9.1^{\circ} \mathrm{C}$ The highest air temperature in the data set is $32.5^{\circ} \mathrm{C}$
(a) Complete the box plot in Figure 1 showing clearly any outliers.
(b) Using your knowledge of the large data set, suggest from which month the two outliers are likely to have come.

Using the data from the large data set, Simon produced the following summary statistics for the daily mean air temperature, $x^{\circ} \mathrm{C}$, for Beijing in 2015

$$
n=184 \quad \sum x=4153.6 \quad \mathrm{~S}_{x x}=4952.906
$$

(c) Show that, to 3 significant figures, the standard deviation is $5.19^{\circ} \mathrm{C}$

Simon decides to model the air temperatures with the random variable

$$
T \sim \mathrm{~N}\left(22.6,5.19^{2}\right)
$$

(d) Using Simon's model, calculate the 10th to 90th interpercentile range.

Simon wants to model another variable from the large data set for Beijing using a normal distribution.
(e) State two variables from the large data set for Beijing that are not suitable to be modelled by a normal distribution. Give a reason for each answer.

Question 2 continued

$$
\begin{gathered}
\text { a) } I Q R=26.6-19.4=7.2 \\
1.5 \times 1 Q R=10.8 \\
19.4+10.8=8.6 \\
26.6+10.8=37.4 .
\end{gathered}
$$

b) October, it is likely to have the coldest temperatures between May and October.
c) $\sigma_{x}=\sqrt{\frac{4952.906}{184}}=5.188 \approx 5.19^{\circ} \mathrm{C}$.
d) $\quad z_{\text {crit }}= \pm 1.2816$

$$
5.19 \times 1.2816 \times 2=13.3^{\circ} \mathrm{C}
$$

e) Daily mean wind speed - this is qualitative.

- Rainfall - distribution is not symmetric, there are plenty of days without rain.

Turn over for a spare grid if you need to redraw your box plot.
3. Barbara is investigating the relationship between average income (GDP per capita), $x$ US dollars, and average annual carbon dioxide $\left(\mathrm{CO}_{2}\right)$ emissions, $y$ tonnes, for different countries.

She takes a random sample of 24 countries and finds the product moment correlation coefficient between average annual $\mathrm{CO}_{2}$ emissions and average income to be 0.446
(a) Stating your hypotheses clearly, test, at the $5 \%$ level of significance, whether or not the product moment correlation coefficient for all countries is greater than zero.

Barbara believes that a non-linear model would be a better fit to the data.
She codes the data using the coding $m=\log _{10} x$ and $c=\log _{10} y$ and obtains the model $c=-1.82+0.89 m$

The product moment correlation coefficient between $c$ and $m$ is found to be 0.882
(b) Explain how this value supports Barbara's belief.
(c) Show that the relationship between $y$ and $x$ can be written in the form $y=a x^{n}$ where $a$ and $n$ are constants to be found.
a) $H_{0}: \rho=0, \quad H_{1}: \rho \geqslant 0$.

$$
\rho_{\text {cñt }}=0.3438 .
$$

$$
0.446>0.3438 \text {. }
$$

Thêre is evidence to suggest $\rho>0$, so we reject $H_{0}$.
b) There is a much stronger positive correlation.
c) $\quad \log _{10} y=-1.82+0.89 \log _{10} x$.

$$
\begin{aligned}
\Rightarrow \quad y & =10^{-1.82+0.89 \log _{10} x} \\
& \Rightarrow y=10^{-1.82} \times 10^{\log _{10} x} 0.89 \\
& \Rightarrow y=0.015 x^{0.89}
\end{aligned}
$$

4. Magali is studying the mean total cloud cover, in oktas, for Leuchars in 1987 using data from the large data set. The daily mean total cloud cover for all 184 days from the large data set is summarised in the table below.

| Daily mean total cloud cover (oktas) | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Frequency (number of days) | 0 | 1 | 4 | 7 | 10 | 30 | 52 | 52 | 28 |

One of the 184 days is selected at random.
(a) Find the probability that it has a daily mean total cloud cover of 6 or greater.

Magali is investigating whether the daily mean total cloud cover can be modelled using a binomial distribution.

She uses the random variable $X$ to denote the daily mean total cloud cover and believes that $X \sim \mathrm{~B}(8,0.76)$

Using Magali's model,
(b) (i) find $\mathrm{P}(X \geqslant 6)$
(ii) find, to 1 decimal place, the expected number of days in a sample of 184 days with a daily mean total cloud cover of 7
(c) Explain whether or not your answers to part (b) support the use of Magali's model.

There were 28 days that had a daily mean total cloud cover of 8
For these 28 days the daily mean total cloud cover for the following day is shown in the
table below.

| Daily mean total cloud cover (oktas) | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Frequency (number of days) | 0 | 0 | 1 | 1 | 2 | 1 | 5 | 9 | 9 |

(d) Find the proportion of these days when the daily mean total cloud cover was 6 or greater.
(e) Comment on Magali's model in light of your answer to part (d).
a) $52+52+28=132$.

184

Question 4 continued
b) i) $\quad x \sim B(8,0.76)$.

$$
\begin{aligned}
& \mathbb{P}(x=6)+\mathbb{P}(x=7)+\mathbb{P}(x=8) . \\
& =\left[\binom{8}{6} 0.76^{66} \times 0.24^{2}+\binom{8}{7} 0.76^{7} \times 0.24+0.76^{8}\right] \\
& =0.703 .
\end{aligned}
$$

ii)

$$
\begin{aligned}
184 & \times \mathbb{P}(x=7) \\
& =184\left(\binom{8}{7} \times 0.76^{7} \times 0.24\right)=51.7
\end{aligned}
$$

c) The probabilities found match those in the original data set. Magali's model is supported.
d) $5+9+9=23$.

$$
1+1+2+1+5+9+9=28
$$

$$
\frac{23}{28}
$$

e) The proportion of days with $C C>6$ increases. Independence does not hold, i.e. value is likely to have high $C C$ if previous day had high CC.

Magali's model may not be suitable.
5. A machine puts liquid into bottles of perfume. The amount of liquid put into each bottle, $D \mathrm{ml}$, follows a normal distribution with mean 25 ml

Given that $15 \%$ of bottles contain less than 24.63 ml
(a) find, to 2 decimal places, the value of $k$ such that $\mathrm{P}(24.63<D<k)=0.45$

A random sample of 200 bottles is taken.
(b) Using a normal approximation, find the probability that fewer than half of these bottles contain between 24.63 ml and $k \mathrm{ml}$

The machine is adjusted so that the standard deviation of the liquid put in the bottles is now 0.16 ml
Following the adjustments, Hannah believes that the mean amount of liquid put in each
bottle is less than 25 ml bottle is less than 25 ml
She takes a random sample of 20 bottles and finds the mean amount of liquid to be
24.94 ml 24.94 ml
(c) Test Hannah's belief at the $5 \%$ level of significance. You should state your hypotheses clearly. (c)
a)

$$
\begin{aligned}
& \frac{24.63-25}{\sigma}=-1.0364 \\
& \Rightarrow \quad z_{\text {crt }}(15 \%)=-1.0364 . \\
& \mathbb{P}(24.63>D)=0.15 \\
& \mathbb{P}(24.63<D<k)=0.45=\mathbb{P}(k>0)-\mathbb{P}(24.63>0) \\
& \Rightarrow \mathbb{P}(k>D)=0.6 \Rightarrow \mathbb{P}(k>D)-0.15 . \\
& \Rightarrow \frac{k-25}{0.357}=0.2533 \\
& \Rightarrow k=250.2533
\end{aligned}
$$

Question 5 continued
b)

$$
\begin{aligned}
& Y \sim B(200,0.45) \\
& \Rightarrow \quad W \sim N(90,49.5) \\
& \mathbb{P}(Y<100) \approx \mathbb{P}(w<99.5) \\
&=\mathbb{P}\left(z<\frac{99.5-90}{\sqrt{49.5}}\right)=0.9115
\end{aligned}
$$

C)

$$
\begin{gathered}
H_{0}: \mu=25, H_{1}: \mu<25 \\
\bar{D} \sim N\left(25, \frac{0.16^{2}}{20}\right) \Rightarrow Z_{\text {crit }}=-1.6449 . \\
\mathbb{P}(\bar{D}<24.94)=\mathbb{P}\left(z<\frac{24.04-25}{\frac{0.16}{\sqrt{20}}}\right)=\mathbb{P}(z<-1.6771) \\
\Rightarrow-1.6771<-1.6449 .
\end{gathered}
$$

The test statistic is in the critical region, so we must reject $H_{0}$, and we hove sufficient evidence to support Hannah's cain.
