# A-level MATHEMATICS

## Paper 2

Wednesday 10 June 2020

Afternoon

Time allowed: 2 hours

### Materials

- You must have the AQA Formulae for A-level Mathematics booklet.
- You should have a graphical or scientific calculator that meets the requirements of the specification.

### Instructions

- Use black ink or black ball-point pen. Pencil should only be used for drawing.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- You must answer each question in the space provided for that question. If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Show all necessary working; otherwise marks for method may be lost.
- Do all rough work in this book. Cross through any work that you do not want to be marked.

### Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 100.

### Advice

- Unless stated otherwise, you may quote formulae, without proof, from the booklet.
- You do not necessarily need to use all the space provided.

## Section A

Do not write  
outside the  
line

Answer all questions in the spaces provided.

- 1 Which one of these functions is decreasing for all real values of  $x$ ?

Circle your answer.

[1 mark]

$f(x) = e^x$

$f(x) = -e^{1-x}$

$f(x) = -e^{x-1}$

$f(x) = -e^{-x}$

- 2 Which one of the following equations has no real solutions?

Tick (✓) one box.

[1 mark]

$\cot x = 0$

$\ln x = 0$

$|x + 1| = 0$

$\sec x = 0$

- 3 Find the coefficient of  $x^2$  in the binomial expansion of  $\left(2x - \frac{3}{x}\right)^8$

[3 marks]

$$\begin{aligned} & {}^8C_3 (2x)^5 \times \left(-\frac{3}{x}\right)^3 \\ &= 56 \times 32 x^5 \times \left(-\frac{27}{x^3}\right) \\ &= -48384 x^2 \end{aligned}$$

$$\text{coefficient} = -48384.$$

Turn over for the next question

Turn over ►

- 4 Using small angle approximations, show that for small, non-zero, values of  $x$

$$\frac{x \tan 5x}{\cos 4x - 1} \approx A$$

where  $A$  is a constant to be determined.

(4 marks)

$$\tan 5x \approx 5x \quad \text{for small values of } x$$

$$\therefore \frac{x \tan 5x}{\cos 4x - 1} \approx \frac{5x^2}{\cos 4x - 1}$$

$$\approx \frac{5x^2}{1 - \frac{(4x)^2}{2} - 1} \quad \left( \text{using } \cos 4x = 1 - \frac{(4x)^2}{2} \right)$$

$$= \frac{5x^2}{-\frac{16x^2}{2}}$$

$$= -\frac{5}{8}$$

$$\text{Therefore } A = -\frac{5}{8}$$

Do not write outside the box

- 5 Use integration by substitution to show that

$$\int_{-\frac{1}{4}}^6 x\sqrt{4x+1} dx = \frac{875}{12}$$

Fully justify your answer.

let  $u = 4x + 1$   $\frac{du}{dx} = 4 \Rightarrow dx = \frac{du}{4}$  [6 marks]

$$x = -\frac{1}{4} \Rightarrow u = 0$$

$$x = 6 \Rightarrow u = 25$$

$$x = \frac{u-1}{4}$$

$$\text{So } \int_{-\frac{1}{4}}^6 x\sqrt{4x+1} dx = \int_0^{25} \left(\frac{u-1}{4}\right) \cdot \sqrt{u} du \cdot \frac{1}{4}$$

$$= \frac{1}{16} \int_0^{25} u^{3/2} - u^{1/2} du$$

$$= \frac{1}{16} \left[ \frac{2u^{5/2}}{5} - \frac{2u^{3/2}}{3} \right]_0^{25}$$

$$= \frac{875}{12}$$

- 6 The line
- $L$
- has equation

$$5y + 12x = 298 \quad (1)$$

A circle,  $C$ , has centre  $(7, 9)$  $L$  is a tangent to  $C$ .

- 6 (a) Find the coordinates of the point of intersection of
- $L$
- and
- $C$
- .

Fully justify your answer.

[5 marks]

$$\text{Line } L: 5y + 12x = 298$$

$$\Rightarrow 5y = 298 - 12x$$

$$\Rightarrow y = \frac{298}{5} - \frac{12}{5}x$$

$$\text{gradient of tangent} = -\frac{12}{5}$$

$\therefore$  gradient of line from the centre,  $(7, 9)$  to  
point of intersection =  $\frac{5}{12}$

Equation of radius to point of intersection:

$$y - 9 = \frac{5}{12}(x - 7)$$

$$\Rightarrow y = \frac{5}{12}x + \frac{73}{12}$$

$$\Rightarrow 12y - 5x = 73 \quad (2)$$

~~$$\text{Multiply (1) by } \frac{12}{5}: 12y + \frac{144}{5}x = \frac{3576}{5} \quad (3)$$~~

~~$$(3) - (2) \Rightarrow \frac{119}{5}x = \frac{3211}{5}$$~~

~~$$\Rightarrow$$~~

$$\text{Rearranging (1)} \Rightarrow y = \frac{73 + 5x}{12}$$

$$\text{Substituting into (2)} \Rightarrow 5 \left( \frac{73 + 5x}{12} \right) + 12x = 298$$

$$\Rightarrow 169x = 3211$$

$$\Rightarrow x = 19$$

$$\Rightarrow y = \frac{73 + 5(19)}{12} = 14$$

Point of intersection =  $(19, 14)$ .

6 (b) Find the equation of C.

[3 marks]

$$r^2 = (19-7)^2 + (14-9)^2 = 169$$

$$\text{Equation: } (x-7)^2 + (y-9)^2 = 169$$

Turn over for the next question

Do not write  
outside the  
box

7  $a$  and  $b$  are two positive irrational numbers.

The sum of  $a$  and  $b$  is rational.

The product of  $a$  and  $b$  is rational.

Caroline is trying to prove  $\frac{1}{a} + \frac{1}{b}$  is rational.

Here is her proof:

Step 1  $\frac{1}{a} + \frac{1}{b} = \frac{2}{a+b}$

Step 2 2 is rational and  $a+b$  is non-zero and rational.

Step 3 Therefore  $\frac{2}{a+b}$  is rational.

Step 4 Hence  $\frac{1}{a} + \frac{1}{b}$  is rational.

7 (a) (i) Identify Caroline's mistake.

[1 mark]

Mistake is step 1:  $\frac{1}{a} + \frac{1}{b} = \frac{2}{a+b}$

---

---

---

---

7 (a) (ii) Write down a correct version of the proof.

[2 marks]

$$\frac{1}{a} + \frac{1}{b} = \frac{a+b}{ab}$$

---

Since  $a+b$  and  $ab$  are rational then  $\frac{a+b}{ab}$   
is rational thus so is  $\frac{1}{a} + \frac{1}{b}$ .

---

---

---

---

---

---

- 7 (b) Prove by contradiction that the difference of any rational number and any irrational number is irrational.

[4 marks]

Assume that the difference of any rational number and any irrational number is rational.

$$\therefore \frac{a}{b} - x = \frac{c}{d} \quad \text{for } a, b, c, d \in \mathbb{Z} \text{ and } x \text{ irrational, where } b, d \neq 0.$$

$$\Rightarrow x = \frac{a}{b} - \frac{c}{d}$$

$$\Rightarrow x = \frac{ad - cb}{bd} \quad \text{which shows } x \text{ is rational,}$$

this is a contradiction, hence difference of any rational number and any irrational number is irrational.

Turn over ►

8 (b) The point  $A$  lies on the curve where  $t = a$

The tangent to the curve at  $A$  is at an angle  $\theta$  to a line through  $A$  parallel to the  $x$ -axis.

The point  $B$  has coordinates  $(1, 0)$

The line  $AB$  is at an angle  $\phi$  to the  $x$ -axis.

8 (b) (i) By considering the gradient of the curve, show that

$$\tan \theta = \frac{1}{a}$$

$$\frac{dx}{dt} = 2t \quad \frac{dy}{dt} = 2$$

[3 marks]

~~diff~~ Differentiating  $y^2 = 4x$

to get  $\frac{dy}{dx} = \frac{dt}{dx} \times \frac{dy}{dt} = \frac{1}{t}$

$$t = a \Rightarrow \frac{dy}{dx} = \frac{1}{a}$$

Gradient of the line = tangent of the angle  
between the line and the horizontal hence

$$\tan \theta = \frac{1}{a}$$

- 8 The curve defined by the parametric equations

$$x = t^2 \text{ and } y = 2t \quad -\sqrt{2} \leq t \leq \sqrt{2}$$

is shown in Figure 1 below.

Figure 1

- 8 (a) Find a Cartesian equation of the curve in the form  $y^2 = f(x)$

[2 marks]

$$t = y/2 \Rightarrow x = \frac{y^2}{4}$$

$$\Rightarrow y^2 = 4x$$

---

---

---

---

---

---

---

---

---

---

Turn over ►

8 (b) (ii) Find  $\tan \phi$  in terms of  $a$ .

[2 marks]

$$A = (a^2, 2a) \quad B = (1, 0)$$

$$\tan \phi = \frac{2a - 0}{a^2 - 1} = \frac{2a}{a^2 - 1}$$

8 (b) (iii) Show that  $\tan 2\theta = \tan \phi$

[3 marks]

$$\tan 2\theta = \frac{2 \tan \theta}{1 - \tan^2 \theta}$$

$$= 2 \times \frac{1}{a}$$

$$= \frac{2}{1 - (1/a)^2}$$

$$= \frac{2a}{a^2 - 1}$$

$$= \tan \phi.$$

Turn over ►

- 9 A cylinder is to be cut out of the circular face of a solid hemisphere. The cylinder and the hemisphere have the same axis of symmetry. The cylinder has height  $h$  and the hemisphere has a radius of  $R$ .

- 9 (a) Show that the volume,  $V$ , of the cylinder is given by

$$V = \pi R^2 h - \pi h^3$$

[3 marks]

$$\text{Radius of cylinder} = r$$

$$\text{Volume of cylinder} = \pi r^2 h$$

$$R^2 = r^2 + h^2$$

$$V = \pi (R^2 - h^2) h$$

$$= \pi R^2 h - \pi h^3$$

- 9 (b) Find the maximum volume of the cylinder in terms of  $R$ .

Fully justify your answer.

$$\frac{dV}{dh} = \pi R^2 - 3\pi h^2 \quad [7 \text{ marks}]$$

$$\text{let } \frac{dV}{dh} = 0$$

$$\Rightarrow \pi R^2 - 3\pi h^2 = 0$$

$$\Rightarrow R^2 - 3h^2 = 0$$

$$\Rightarrow 3h^2 = R^2$$

$$\Rightarrow h = \frac{R}{\sqrt{3}} \quad (h > 0)$$

$$V = \pi R^2 \cdot \frac{R}{\sqrt{3}} - \pi \left( \frac{R}{\sqrt{3}} \right)^3$$

$$= \frac{\pi R^3}{\sqrt{3}} - \frac{\pi R^3}{3\sqrt{3}}$$

$$= \frac{3\pi R^3 - \pi R^3}{3\sqrt{3}} = \frac{2\pi R^3}{3\sqrt{3}} = \frac{2\sqrt{3}\pi R^3}{9}$$

Turn over for Section B

Turn over ►

## Section B

Do not write  
outside the  
boxAnswer **all** questions in the spaces provided.

- 10 A vehicle is driven at a constant speed of  $12 \text{ m s}^{-1}$  along a straight horizontal road.  
Only one of the statements below is correct.

Identify the correct statement.

Tick (✓) **one** box.

[1 mark]

The vehicle is accelerating

The vehicle's driving force exceeds the total force resisting its motion

The resultant force acting on the vehicle is zero

The resultant force acting on the vehicle is dependent on its mass

- 11 A number of forces act on a particle such that the resultant force is  $\begin{pmatrix} 6 \\ -3 \end{pmatrix} \text{ N}$

One of the forces acting on the particle is  $\begin{pmatrix} 8 \\ -5 \end{pmatrix} \text{ N}$ 

Calculate the total of the other forces acting on the particle.

Circle your answer.

[1 mark]

$\begin{pmatrix} 2 \\ -2 \end{pmatrix} \text{ N}$

$\begin{pmatrix} 14 \\ -8 \end{pmatrix} \text{ N}$

$\begin{pmatrix} -2 \\ 2 \end{pmatrix} \text{ N}$

$\begin{pmatrix} -14 \\ 8 \end{pmatrix} \text{ N}$

- 12 A particle,  $P$ , is moving with constant velocity  $8i - 12j$   
A second particle,  $Q$ , is moving with constant velocity  $ai + 9j$   
 $Q$  travels in a direction which is parallel to the motion of  $P$ .  
Find  $a$ .

Circle your answer.

[1 mark]

-6

-5

5

6

Turn over for the next question

- 13** A uniform rod,  $AB$ , has length 7 metres and mass 4 kilograms.  
The rod rests on a single fixed pivot point,  $C$ , where  $AC = 2$  metres.  
A particle of weight  $W$  newtons is fixed at  $A$ , as shown in the diagram.

The system is in equilibrium with the rod resting horizontally.

- 13 (a)** Find  $W$ , giving your answer in terms of  $g$ .

[2 marks]

$$2W = 1.5 \times 4g$$

$$W = 3g$$

- 13 (b)** Explain how you have used the fact that the rod is uniform in part (a).

[1 mark]

The rod is uniform so its weight  
acts at the centre.

- 14 At time  $t$  seconds a particle,  $P$ , has position vector  $r$  metres, with respect to a fixed origin, such that

$$r = (t^3 - 5t^2)\mathbf{i} + (8t - t^2)\mathbf{j}$$

- 14 (a) Find the exact speed of  $P$  when  $t = 2$

[4 marks]

Differentiating:  $\underline{v} = (3t^2 - 10t)\mathbf{i} + (8 - 2t)\mathbf{j}$

when  $t = 2$ ;  $\underline{v} = (12 - 20)\mathbf{i} + (8 - 4)\mathbf{j}$

$$\Rightarrow \underline{v} = -8\mathbf{i} + 4\mathbf{j}$$

$$\text{Speed} = \sqrt{8^2 + 4^2} = 4\sqrt{5} \text{ m s}^{-1}$$

- 14 (b) Bella claims that the magnitude of acceleration of  $P$  will never be zero.

Determine whether Bella's claim is correct.

Fully justify your answer.

[3 marks]

Differentiating:  $\underline{a} = (6t - 10)\mathbf{i} - 2\mathbf{j}$

$$|a| = \sqrt{(6t - 10)^2 + 2^2} (= 36t^2 - 120t + 100 + 4)$$

$$|a| \geq 2 \quad (\text{as } (6t - 10)^2 \geq 0)$$

So  $|a|$  will never be 0, hence Bella is correct.

15

A particle is moving in a straight line with velocity  $v \text{ ms}^{-1}$  at time  $t$  seconds as shown by the graph below.

Do not write  
outside the  
box

15 (a)

Use the trapezium rule with four strips to estimate the distance travelled by the particle during the time period  $20 \leq t \leq 100$

[4 marks]

$$h = 20$$

$$\text{Area} = \frac{20}{2} (130 + 2(140 + 120 + 80) + 0)$$

$$= 810 \text{ m}$$

- 15 (b) Over the same time period, the curve can be very closely modelled by a particular quadratic.

Explain how you could find an alternative estimate using this quadratic.

[1 mark]

Integrating the quadratic between the  
limits 20 and 100.

Turn over for the next question

Turn over ►

- 16 Two particles  $A$  and  $B$  are released from rest from different starting points above a horizontal surface.

$A$  is released from a height of  $h$  metres.

$B$  is released at a time  $t$  seconds after  $A$  from a height of  $kh$  metres, where  $0 < k < 1$

Both particles land on the surface 5 seconds after  $A$  was released.

Assuming any resistance forces may be ignored, prove that

$$t = 5(1 - \sqrt{k})$$

Fully justify your answer.

[5 marks]

$$\text{Particle } A : s = h, a = g, u = 0, t = 5$$

$$s = ut + \frac{1}{2}at^2 = \frac{1}{2} \times g \times 5^2 = \frac{25}{2}g$$

$$\therefore h = \frac{25}{2}g$$

$$\text{Particle } B : s = kh, a = g, u = 0, t = 5 - t$$

$$\Rightarrow \frac{25}{2}gk = \frac{1}{2} \times g \times (5 - t)^2$$

$$\Rightarrow 25k = (5 - t)^2$$

$$\Rightarrow 5\sqrt{k} = 5 - t \quad (\text{as } 0 < t < 5)$$

$$\Rightarrow t = 5(1 - \sqrt{k}).$$

- 17 A ball is projected forward from a fixed point,  $P$ , on a horizontal surface with an initial speed  $u \text{ m s}^{-1}$ , at an acute angle  $\theta$  above the horizontal.

Do not write  
outside the  
box

The ball needs to first land at a point at least  $d$  metres away from  $P$ .

You may assume the ball may be modelled as a particle and that air resistance may be ignored.

Show that

$$\sin 2\theta \geq \frac{dg}{u^2}$$

[6 marks]

Vertically:  $u_y = u \sin \theta$ ,  $a = -g$

$$\Rightarrow 0 = ut \sin \theta - 0.5 \times g \times t^2$$

$$\Rightarrow 0 = u \sin \theta - 0.5gt \quad (t \neq 0)$$

$$\Rightarrow \frac{gt}{2} = u \sin \theta$$

$$\Rightarrow t = \frac{2u \sin \theta}{g}$$

Horizontally:  $u_x = u \cos \theta$  *new*

$$x = ut \cos \theta$$

$$\Rightarrow x = u \frac{2u \sin \theta}{g} \cos \theta$$

$$\Rightarrow x = \frac{u^2 \sin 2\theta}{g} \quad (\sin 2\theta = 2 \sin \theta \cos \theta)$$

$$\Rightarrow x = \frac{u^2 \sin 2\theta}{g}$$

$$x \geq d \quad \text{then} \quad \frac{u^2 \sin 2\theta}{g} \geq d$$

$$\Rightarrow \sin 2\theta \geq \frac{dg}{u^2}$$

- 18 Block A, of mass 0.2 kg, lies at rest on a rough plane.

The plane is inclined at an angle  $\theta$  to the horizontal, such that  $\tan \theta = \frac{7}{24}$

A light inextensible string is attached to A and runs parallel to the line of greatest slope until it passes over a smooth fixed pulley at the top of the slope.

The other end of this string is attached to particle B, of mass 2 kg, which is held at rest so that the string is taut, as shown in the diagram below.

- 18 (a) B is released from rest so that it begins to move vertically downwards with an acceleration of  $\frac{543}{625} \text{ gms}^{-2}$

Show that the coefficient of friction between A and the surface of the inclined plane is 0.17

[8 marks]

$$F = ma$$

$$T - W \sin \theta - F = ma$$

$$\Rightarrow T - 0.2g(0.28) - 0.2\mu g(0.96) = 0.2 \times \frac{543}{625} g \quad (\text{particle A})$$

$$\Rightarrow 2g - T = 2 \times \frac{543}{625} g \quad (\text{particle B})$$

$$\Rightarrow 2g - (0.2g(0.28) + 0.2\mu g(0.96)) = 2 \times \frac{543}{625} g$$

$$= 2 \times \frac{543}{625} g$$

$$\Rightarrow 2g - 0.2g(0.28) - 0.2\mu g(0.96) = 2 \times \frac{543}{625} g$$

$$\Rightarrow 2 - 1.944 - 0.192\mu = 1.9136$$

$$\Rightarrow \mu = \frac{1.944 - 1.9136}{0.192} = 0.17$$

18 (b) In this question use  $g = 9.81 \text{ ms}^{-2}$

When A reaches a speed of  $0.5 \text{ ms}^{-1}$  the string breaks.

18 (b) (i) Find the distance travelled by A after the string breaks until first coming to rest.

[4 marks]

$$T = 0, \quad g = 9.81 \text{ ms}^{-2} \quad F = ma$$

$$-0.2 \times 9.81 \times (0.28) - 0.2(0.17) \times 9.81 \times 0.96 = 0.2a$$

$$a = -4.347792.$$

$$v^2 = u^2 + 2as$$

$$\Rightarrow s = 0.0288 \text{ m.}$$

18 (b) (ii) State an assumption that could affect the validity of your answer to part (b)(i).

[1 mark]

The string does not obstruct the block

or no air resistance.

- 19 A particle moves so that its acceleration,  $a \text{ m s}^{-2}$ , at time  $t$  seconds may be modelled in terms of its velocity,  $v \text{ m s}^{-1}$ , as

$$a = -0.1v^2$$

The initial velocity of the particle is  $4 \text{ m s}^{-1}$

- 19 (a) By first forming a suitable differential equation, show that

$$v = \frac{20}{5+2t}$$

[6 marks]

$$\frac{dv}{dt} = -0.1v^2$$

$$\Rightarrow \int -\frac{1}{v^2} dv = \int 0.1 dt$$

$$\Rightarrow \frac{1}{v} = 0.1t + c$$

$$\Rightarrow \frac{1}{4} = 0.1(0) + c$$

$$\Rightarrow c = \frac{1}{4}$$

$$\Rightarrow \frac{1}{v} = 0.1t + 0.25$$

$$\Rightarrow v = \frac{1}{0.1t + 0.25}$$

$$\Rightarrow v = \frac{20}{5+2t}$$

19 (b) Find the acceleration of the particle when  $t = 5.5$

[2 marks]

$$v = \frac{20}{5 + 2(5.5)} = \frac{20}{16} = 1.25$$

$$a = -0.1v^2 = -0.1(1.25)^2 = -0.15625 \text{ m s}^{-2}$$

Do not write  
outside the  
box

END OF QUESTIONS
