| $\mathbf{0}$ | $\mathbf{2}$. | $\mathbf{1}$ A student carried out an experiment to determine the enthalpy of combustion of |
| :--- | :--- | :--- | methanol.

Methanol was placed in a spirit burner and the mass of the spirit burner measured. The student placed 100 g of water in a copper calorimeter and clamped it above the spirit burner. The burner was lit and allowed to burn for a few minutes. The flame was then extinguished and the new mass of the spirit burner found.

The measured temperature rise was $38.0^{\circ} \mathrm{C}$. The specific heat capacity of water is $4.18 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~g}^{-1}$.

Figure 1, a diagram of the apparatus, is shown alongside Table 1 which shows the measurements the student recorded.
